

Implement Client Script & UI Policy (Incident)

Phase 1 – Brainstorming & Ideation

1.1 Purpose

The purpose of this phase is to identify a practical problem related to ServiceNow Incident Management and convert it into a focused solution using **UI Policies and Client Scripts**.

1.2 Problem Identified

Incident records may require different field behaviours depending on the information entered by the user. Without appropriate configuration, important fields may not become mandatory when required, values may not be updated automatically, and users may make unwanted changes directly from the Incident list.

These situations can affect data consistency and the proper handling of Incident records.

The project therefore focuses on using **ServiceNow UI Policies and Client Scripts** to provide dynamic field control, validation, automatic updates, and controlled Incident modifications.

1.3 User Story

As a ServiceNow Incident user, I want the Incident form to automatically control relevant fields and validate important information so that Incidents can be submitted correctly and unwanted changes can be prevented.

1.4 Proposed Idea

The proposed solution is to implement a set of **UI Policies and Client Scripts** on the ServiceNow Incident table.

The solution includes:

- A UI Policy for **High Impact Incidents**.
- A UI Policy Action to control the **Urgency** field.
- An **onChange Client Script** to automatically set Urgency when Impact is High.
- An **onSubmit Client Script** to prevent submission when Assigned To is missing for a High Impact Incident.
- An **onCellEdit Client Script** to prevent direct State changes through Incident list editing.

- Testing of the implemented configurations under different conditions.
-

1.5 Expected Value

The proposed solution is expected to provide:

- More consistent Incident data.
 - Better control of Incident form fields.
 - Automatic updating of relevant field values.
 - Prevention of incomplete High Impact Incident submissions.
 - Prevention of unwanted State changes through list editing.
 - Improved user interaction with the Incident form.
 - Better validation of Incident records.
-

1.6 Ideation Output

Selected concept: Implement **Client Scripts and UI Policies** on the ServiceNow Incident form to provide dynamic field behaviour, automatic value updates, submission validation, and controlled State modification.

The selected concept forms the basis for the subsequent requirement analysis, system design, development, testing, documentation, and demonstration phases.
